TISSUE SPECIFICITY: EXPRESSED SPECIFICALLY IN DEVELOPING AND ADULT
SKELETAL MUSCLE. WEAK EXPRESSION IN ADIPOSE TISSUE.
DEVELOPMENTAL STAGE: FIRST DETECTED AT DAY 9.5 POST-COITUM IN
ONE-THIRD OF DEVELOPING SOMITES. AT DAY 10.5, EXPRESSED IN THE
MYOTOME COMPARTMENT OF SOMITES. AT LATER STAGES OF DEVELOPMENT,
DETECTED IN A WIDE RANGE OF DEVELOPING MUSCLES. EXPRESSION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SIMILARI

                                                                           H
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DEVELOPMENTAL STAGE: FIRST STRONGLY EXPRESSED IN RESTRICTED DOMAINS AT 8.5 DAYS POST COITUS (DPC) WHERE IT IS HIGHEST IN THE TAIL BUD. AT 10.5 DPC, EXPRESSED IN THE BRANCHIAL ARCHES, LIMB BUD, TAIL BUD AND POSTERIOR DORSAL NEURAL TUBE. LATER, EXPRESSED IN TERMINALLY-DIFFERENTIATED ODONTOBLASTS, THE NASAL EPITHELIUM, RETINA AND SPECIFIC REGIONS OF THE BRAIN.

SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PLAY CRITICAL ROLES IN PATTERNING BOTH MESODERMAL AND NEURAL TISSUES AND IN ESTABLISHING THE SKELETAL PATTERN.
SUBUNIT: HOMODIMER; DISULFIDE-LINKED (BY SIMILARITY).
SUBCELLULAR LOCATION: Secreted (Probable).
TISSUE SPECIFICITY: HIGHLY EXPRESSED IN THE DEVELOPING LIMB BUD, INITIALLY DETECTED IN THE DISTAL MESENCHYME, AND LATER LOCALIZING TO REGIONS AROUND THE DEVELOPING BONES. IS ALSO EXPRESSED IN ADULT DENTAL PULP AND BRAIN.

McPherron A.C., Lawler A.M., Lee S.-J.;
"Regulation of anterior/posterior patterning of the axial signathing the second of the axial signathing that acts globally to specify nat. Genet. 22:260-264(1999).

-!- FUNCTION: SECRETED SIGNAL THAT ACTS GLOBALLY TO SPECIFY IDENTITY ALONG THE ANTERIOR/POSTERIOR AXIS DURING DEVEL PLAY CRITICAL ROLES IN PATTERNING BOTH MESODERMAL AND NOTICE AND IN ESTABLISHING THE SKELETAL PATTERN.

-!- SUBCELLULAR LOCATION: Secreted (Probable).

-!- SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             16-OCT-2001 (Rel. 40, Lands 15-JUN-2002 (Rel. 41, Lands Growth/differentiation 11).

inhibin beta-B chain precursor - rat

N;Alternate names; inhibin/activin beta B-chain

C;Species: Rattus norvegicus (Norway rat)

C;Date: 03-Apr-1992 #sequence revision 01-Aug-1997 #text_change 16-Jul-1999

C;Accession: B41398; I53288; C40905

C;Comment: The source of this protein is ovarian follicular fluid.

C;Comment: The mature protein is the carboxyl-terminal segment of a precursor polypeptic ifferent forms of inhibin have been isolated (A and B) that differ in the amino-terminal c;Comment: Inhibin is secreted by ovaries or testes and inhibits the secretion of follit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A40150

C; Comment: The source of this protein is ovarian follicular fluid.
C; Comment: The mature protein is the carboxyl-terminal segment of a precursor polypeptid ifferent forms of inhibin have been isolated (A and B) that differ in the amino-terminal C; Comment: Inhibin is secreted by ovaries or testes and inhibits the secretion of follit C; Superfamily: inhibin
C; Superfamily: inhibin
C; Keywords: contraceptive; follitropin inhibitor; glycoprotein; gonad
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inhibin beta-B chain precursor - pig (fragment)
C;Species: Sus scrofa domestica (domestic pig)

                                                                                                                                                                                                                                                                     SUBUNIT: HOMODIMER; DISULFIDE-LINKED (BY SIMILARITY).
TISSUE SPECIFICITY: EXPRESSED SPECIFICALLY IN DEVELOPING AND SKELETAL MUSCLE. WEAK EXPRESSION IN ADIPOSE TISSUE.
DEVELOPMENTAL STAGE: FIRST DETECTED AT DAY 9.5 POST-COITUM IN ONE-THIRD OF DEVELOPING SOMITES. AT DAY 10.5, EXPRESSED IN TH MYOTOME COMPARTMENT OF SOMITES. AT LATER STAGES OF DEVELOPMEN DETECTED IN A WIDE RANGE OF DEVELOPING MUSCLES. EXPRESSION CONTINUES IN ADULTHOOD.
SIMILARITY: BELONGS TO THE TGF-BETA FAMILY.

-!- FUNCTION: ACTS SPECIFICALLY AS A NEGATIVE REGULATOR OF SKELETAL MUSCLE GROWTH.

-!- SUBUNIT: HOMODIMER; DISULFIDE-LINKED (BY SIMILARITY).

-!- TISSUE SPECIFICITY: SPECIFICALLY EXPRESSED IN DEVELOPING AND ADULT SKELETAL MUSCLE. HIGHEST LEVELS FOUND IN THE HINDLIMB MUSCLES

M.SEMIMEMBRANOSUS AND M.BICEPS FEMORIS; LOW LEVELS IN OTHER HINDLIMB MUSCLES.

-!- DEVELOPMENTAL STAGE: WIDELY EXPRESSED THROUGHOUT DEVELOPMENT.

-!- DEVELOPMENTAL STAGE: WIDELY EXPRESSED THROUGHOUT DEVELOPMENT.

-!- DISEASE; DEFECTS IN GDEN ARE THE CAUSE OF THE DOUBLE-MUSCLE PHENOTYPE OR MUSCULAR HYPERTROPHY (MH), AN AUTOSOMAL RECESSIVE DISEASE FREQUENTLY FOUND IN THE BELGIAN BLUE AND PIEDMONTESE CAUTILE BREEDS. THIS DISEASE IS CHARACTERIZED BY AN INCREASED NUMBER OF MUSCLE FIBERS (HYPERPLASIA), RESULTING IN AN INCREASE IN MUSCLE MASS OF 20-25%.
